(54) Title: SYNTHESIS OF LACTAMS

(57) Abstract: Methods for the synthesis of lactams are presented whereby a carboxylic acid of the formula HOOC-----OR---NH-LG, wherein OR is an organic moiety and LG is a leaving group, is reacted with an acid, such as an organic acid, in particular a strong acid, and a dehydrating agent, which may be one in the same such as a strong acid anhydride, such that the amount of acid added allows for the desired transformation to take place without the loss of the leaving group (LG) before the cyclization, and recovering the lactam.

SYNTHESIS OF LACTAMS

CROSS-REFERENCE TO RELATED APPLICATIONS

This application is related to and claims the benefit of co-pending provisional U.S. Application No.61/638,491 filed April 26, 2012 which is hereby incorporated by reference in its entirety for all purposes.

FIELD OF THE INVENTION

The invention relates to processes to synthesize lactam compounds, such as for pharmaceuticals.

BACKGROUND OF THE INVENTION

There exists a number of approaches for the synthesis of lactams. For example, the classical approach for the synthesis of lactams involves cyclization of the amine onto an ester as exemplified in the Roche case in this patent or N-alkylation followed by acylation onto an acylhalide (Raghavan et al. J Org Chem. 2006 March 3; 71(5): 2151), Rhodium catalyzed intramolecular C-H insertion of alpha-diazo-alpha-(phenylsulfonyl)acetamides derived from alpha-amino acids (Yoon et al., J. Org Chem., 2002, 67 (18) 6582), [2+2] cycloaddition reactions for the synthesis of β -lactams (Bari S.S. et al, Top Heterocycl Chem (2010) 22: 49; Kidwai M. et al. Current Medicinal Chemistry 6(3) 1999, 195). Palladium catalyzed lactam formation (Honda T. et al. Org Lett., 2001, 3(4) 631. Most of these approaches are based on an acylation approach wherein the amine needs to be nucleophilic enough for the transformation to take effect.

SUMMARY OF THE INVENTION

The process invention is directed to the synthesis of a lactam ring of the formula (a)

wherein G represents 1- 5 atoms to complete said ring wherein, reading from left to right, G represents: -C- for a 4-membered ring and -C-C-, -C-O-, -O-C-, -N-C, . -C-N- for a 5

membered ring and similar arrangements of C, O, N, for 6, 7 and 8-membered rings where any open valences are H or an organic moiety such as alkyl or where open valences represent a ring bonded to adjacent atoms or the same atom as allowed by valence such as a spiro ring, which comprises the steps of

(i) treating a carboxylic acid of the formula (b)

(b)

with an acid such as a strong acid and a dehydrating agent wherein LG is a leaving group such as tBoc such that the amount of strong acid added allows for the desired transformation to take place without the loss of the leaving group (LG) before the cyclization, and

(ii) recovering the lactam (a).

The final product lactams or pharmaceutically acceptable salts thereof may be useful as CDK inhibitors for treatment of diseases and disorders mediated by CDK such as cancer.

DETAILED DESCRIPTION OF THE INVENTION

The invention reactions involving G create cyclic moieties that define 4-8 membered substituted or unsubstituted rings such as β -lactams, pyrrolidones, piperidones to name a few. Lactams of formula (a) may be substituted or unsubstituted 5-8 membered ring systems containing heteroatoms such as oxazolidinones, thiazolidinones, oxazinanones, thiazinanones, oxazepanones, thiazepanones just to name a few. Besides the use of trifluoroacetic anhydride, other strong acid anhydrides can also be used. For example, tribromoacetic anhydride, trichloroacetic anhydride or mixed anhydrides. In these cases an additional step may be necessary for the removal of LG. In general, most reactions of the invention are conducted at ambient temperature such as about 0-100^o C or about 10-50^o C, and involve the use of either nonpolar solvents such as dichloromethane, toluene, benzene, dichloroethane or polar aprotic solvents such as tetrahydrofuran, dioxane or acetonitrile. The dehydrating agent may be a carbodiimide-based such as DCC and EDC, an aminium-based agent such as HBTU, TBTU, HATU, HCTU, a phosphonium-based such as BOP, PyBOP, PyAOP, PyBroP, a uronium-based such as TSTU, TOTU, TPTU or another agent such as DEPBT, CDI or T3P. LG may also be an alkylcarbamate, including cyclic and branched

chain alkyls, arylcarbamates, or heteroarylcarbamates, or alkylamides, arylamides or heteroarylamides (including substituted aryls or heteros). An additional step may be necessary for removal of LG from the cyclized lactam.

For example, the lactam (QQQ) below may be synthesized from the acid (RRR) according to the invention which comprises cyclizing an acid of the formula (RRR), wherein LG is a leaving group such as the atoms to form alkyl or aryl carbamates such as tBoc. The reaction conditions for the cyclization can be a one step process wherein, the addition of reagents are all done in one pot resulting in the direct formation of the lactam with the loss of LG. In certain cases, an additional step might be desirable for the loss of the LG after lactam formation.

The process of claim 1, wherein the dehydrating agent and the acid comprise an acid anhydride composed of two molecules of the same acid such as trifluoroacetic acid or other trihaloacetic acids or dihaloacetic acids or aryl/heteroaryl or substituted aryl/heteroaryl acid anhydrides such as para-nitrobenzoic acid anhydride.

7. The process of claim 1, wherein the dehydrating agent is a carbodiimide-based such as DCC and EDC, an aminium-based agent such as HBTU, TBTU, HATU, HTCU, a phosphonium-based such as BOP, PyBOP, PyAOP, PyBroP, a uronium-based such as TSTU, TOTU, TPTU or another agent such as DEPBT, CDI or T3P.

8. A compound of the following formulae (RRR) or (QQQ):

wherein

R^{37} is a value of R^8 for formula (I), (II) or (III) or R^{37} is a value of R^{14} for formula (IV);

R^{31} , yy and ZZ are as defined above for (Q);

Y is $-CH-$ or $-N$;

L as allowed by valance is hydrogen, aryl, heteroaryl, C_1 - C_8 alkoxy, aryloxy, heteroaryloxy, C_1 - C_8 alkyl, cycloalkylalkyl, or $-TT-RR$ as defined above for the formula (Q), C_1 - C_8 cycloalkyl or cycloalkyl containing one or more heteroatoms selected from N, O and S; and

R^{65} is any leaving group that can be displaced by primary amine, for example to create an intermediate for a final product, such as Cl, Br, I, F, SMe, SOMe, SO_2Me , SOalkyl, SO_2alkyl , SOaryl, SO_2aryl , hydroxy, hydroxyalkyl, hydroxyaryl or hydroxyheteroaryl, or R^{65} may be a value of R^{55} for the formula (Q).

Box No. II Observations where certain claims were found unsearchable (Continuation of item 2 of first sheet)

This international search report has not been established in respect of certain claims under Article 17(2)(a) for the following reasons:

1. Claims Nos.:
because they relate to subject matter not required to be searched by this Authority, namely:

2. Claims Nos.: 8-9
because they relate to parts of the international application that do not comply with the prescribed requirements to such an extent that no meaningful international search can be carried out, specifically:
Claims 8-9 are unsearchable because they attempt to define the substituents R37, R31, yy, ZZ of the formulas in the present claims merely as 'R8 for formula (I), (II), (III)', 'R14 for formula (IV), or '(Q)' instead of definition of the substituents or reference to the number of claim expressly stated in the claims.

3. Claims Nos.:
because they are dependent claims and are not drafted in accordance with the second and third sentences of Rule 6.4(a).

Box No. III Observations where unity of invention is lacking (Continuation of item 3 of first sheet)

This International Searching Authority found multiple inventions in this international application, as follows:

1. As all required additional search fees were timely paid by the applicant, this international search report covers all searchable claims.

2. As all searchable claims could be searched without effort justifying an additional fee, this Authority did not invite payment of any additional fee.

3. As only some of the required additional search fees were timely paid by the applicant, this international search report covers only those claims for which fees were paid, specifically claims Nos.:

4. No required additional search fees were timely paid by the applicant. Consequently, this international search report is restricted to the invention first mentioned in the claims; it is covered by claims Nos.:

Remark on Protest

- The additional search fees were accompanied by the applicant's protest and, where applicable, the payment of a protest fee.
- The additional search fees were accompanied by the applicant's protest but the applicable protest fee was not paid within the time limit specified in the invitation.
- No protest accompanied the payment of additional search fees.
